ENVIRONMENTAL POLICY

The Board of Directors of CMO VALVES TECHNOLOGY, S.L. is responsible for establishing strategies, approving company policies, and defining its internal processes. Respect for the environment, minimizing the environmental impact of its production process, resilience against climate challenges, and compliance with current regulations are the pillars of its production model.

In the exercise of these responsibilities, and with the aim of developing what is established in the company's corporate philosophy, the Board of Directors approves this Environmental Policy.

1. Purpose

The company's Board of Directors considers the environment to be the cornerstone of sustainability. The company is aware of its capacity to contribute to environmental conservation and recognizes that climate change is a critical factor affecting both its business context and the continuity of its operations. Therefore, it assumes the responsibility to act actively in climate change mitigation and adaptation, as well as in biodiversity preservation.
Furthermore, the company views respect for the environment as one of the core corporate values that define its business strategy, being key to configuring a sustainable production model. This translates into lower greenhouse gas emissions, greater efficiency in energy production and use, carbon footprint reduction, strict compliance with environmental regulations, and the adoption of international best practices in this area.

2. Environmental Organization

The execution of the Environmental Policy within the company falls under the responsibility of Department Managers, thereby addressing environmental management in a decentralized manner. The Board of Directors will oversee environmental strategy and organization, defining guidelines, targets, and the necessary resource allocation to address environmental opportunities and risks stemming from climate change.

3. Environmental Commitments

Likewise, the company optimizes water and energy management, as well as the management of hazardous and non-hazardous waste. This is carried out through implemented systems that set objectives and targets for waste reduction, the adoption of good practices in water consumption, the use of recycled materials, energy efficiency, and the control and progressive reduction of greenhouse gas (GHG) emissions.

4. Monitoring Instruments for Environmental Commitments

The company's environmental commitments are driven through an organizational structure with defined responsibilities, this Environmental Policy, resource management and investment optimization, the establishment of a strategic plan that determines the priorities of verifiable objectives, continuous assessment of climate vulnerability, and staff training and awareness raising.

5. Basic Guiding Principles on Environmental Matters

To meet these commitments, the Company shall be guided by the following principles:

- Comply with prevailing environmental legislation and anticipate emerging regulations relating to the ecological transition.
- Continuously identify and assess the environmental risks associated with its facilities, including the physical and transition risks arising from climate change, and strengthen the mechanisms designed to mitigate or eliminate such risks.
- Establish indicators and reporting systems (including carbon footprint and energy performance) enabling an objective understanding and comparison of the environmental impact of the Company's various activities, through their categorization and the identification of their root causes, so that such information may be used effectively to support decision-making.

- Prevent the materialization of such risks and, where applicable, mitigate their consequences; consume responsibly by ensuring the sustainable use of resources and, to the extent practicable, increasing the use of renewable energy and resources.
- Integrate climate change and environmental sustainability considerations into decision-making processes concerning investments, product and service design, and the planning and execution of activities.
- Develop plans that set objectives and targets, and keep up to date the emergency plans for extreme weather events and environmental incidents, thereby reducing risks, minimizing adverse effects, and enabling regular monitoring of progress through internal audits.
- Promote research and development of new technologies, processes, and materials that enable more efficient use of natural resources and reduce emissions, advancing steadily toward a carbon-neutral and circular production model.
